Problem Statement Definition

Date	29-09-2026
Team ID	SWTID-2026-1971
Project Title	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. Original Problem Statement:

The current IT procurement process lacks efficiency and automation, resulting in delays and manual overhead, particularly in handling standard laptop orders. Requests for standard laptops often require configuration, but this step is prone to oversight or delay, leading to frustration among users and inefficient resource allocation within the IT department.

2. Defined Problem Statement – Structured Format

Element	Details
Title	Inefficient and Manual Standard Laptop Procurement Process
Who is affected?	End users requesting laptops, IT Procurement Team, Hardware Team
What is the problem?	No automated workflow exists after a standard laptop request is approved. The task for laptop configuration is created manually, often missed or delayed.
When does it occur?	After a user places an order from Service Catalog > Standard Laptop >

	Approval stage
Where does it occur?	ServiceNow – Service Catalog, Request Management, Catalog Task Module
Why is it a problem?	1. User wait time increases 2. Manual intervention and errors 3. Poor resource utilization 4. Bad user experience
Impact	Frustration for users, productivity loss for IT, procurement SLA breach

3. Final Improved Problem Definition :

In the current ServiceNow environment, the process for handling standard laptop orders is fully manual. Once a request is approved, there is no automated system to trigger and assign the configuration task to the Hardware team. This manual handover causes missed tasks, delayed configurations, and increased workload for the IT procurement team. There is a need for an automated Flow that triggers on Service Catalog submission and auto-creates a Catalog Task with Short Description "Laptop need to Configured" assigned to Hardware group.
