Team ID	SWTID-2026-1971
Project Title	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Performance Testing Objectives

- Verify that the **Standard Laptop** request is processed smoothly through the Service Catalog.
- Check that the approval process works correctly without unnecessary delays.
- Verify that **Flow Designer automatically creates the Catalog Task** after approval.
- Check that the task is assigned correctly to the **Hardware** group.
- Verify that the task status and request details are updated correctly.
- Ensure that automation reduces manual processing and user waiting time.
- Check that the workflow performs efficiently during multiple laptop requests.

Performance Test Cases

Test Case	Test Scenario	Expected Result
PT01	Submit a Standard Laptop request	Request should be created successfully
PT02	Approve the laptop request	Request should move to the approved state
PT03	Trigger the Flow Designer workflow	Catalog Task should be created automatically
PT04	Check task assignment	Task should be assigned to the Hardware group
PT05	Check task details	Short description and required fields should be updated correctly
PT06	Check request status	Updated request/task status should be visible
PT07	Submit multiple laptop requests	Requests should be processed without unnecessary delays
PT08	Verify manual intervention	Task creation and assignment should occur automatically

Performance Outcome

The system should process Standard Laptop requests efficiently, automatically create and assign configuration tasks after approval, and provide updated status information. The automation is expected to reduce manual overhead and user waiting time while improving the efficiency of the IT procurement process.
