Project Title	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Standard Laptop Procurement

Stage	Customer Action	System / IT Response	Customer Experience
1. Need Identification	User needs a standard laptop and decides to request one.	—	Recognizes the need for a laptop.
2. Request Placement	User opens **Service Catalog → Hardware → Standard Laptop → Order Now**.	System creates the service request.	Easy and straightforward request process.
3. Approval	User waits for the request to be approved.	Approver reviews and approves the request.	Can track the request status.
4. Automatic Task Creation	No manual action required from the user.	**Flow Designer automatically creates a Catalog Task** after approval.	Less waiting and less manual intervention.
5. Hardware Assignment	—	Task is automatically assigned to the **Hardware** group with the configuration requirement.	User doesn't need to contact the hardware team separately.
6. Laptop Configuration	User waits for the laptop to be configured.	Hardware team receives the task and configures the laptop.	Faster preparation of the laptop.
7. Status Tracking	User can check the request and task status.	ServiceNow displays the request/catalog task information.	Better visibility into the process.

8. Completion	User receives the configured laptop.	Procurement and configuration process is completed.	Reduced waiting time and smoother experience.

Simple Customer Journey Flow:

Need Laptop → Place Request → Approval → Automatic Task Creation → Hardware Team Assignment → Laptop Configuration → Status Tracking → Laptop Received

The automation is intended to provide a seamless experience, reduce manual intervention, optimize task allocation, and minimize user waiting time.

And the actual journey starts with ordering the **Standard Laptop** through the Service Catalog and ends with checking the automatically created Catalog Task and its assigned group/status.
