Project Title	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. ServiceNow

ServiceNow is the main platform used for implementing the IT procurement workflow. The Standard Laptop request is created and managed through the Service Catalog.

2. Flow Designer

Flow Designer is the primary automation tool used in the project. It is used to create the workflow that automatically generates the laptop configuration task after approval.

3. Service Catalog

The **Service Catalog** is used to provide the Standard Laptop item through which users can place laptop requests.

4. Catalog Tasks

Catalog Tasks are used to manage the laptop configuration activity. The workflow automatically creates a task with the description and assigns it to the **Hardware** group.

5. Service Request / Requested Item

The **Service Request and Requested Item records** are used to manage the laptop request and provide the information required for creating the Catalog Task.

6. Process Engine

The Standard Laptop catalog item is configured to use the created Flow instead of the previous automation under the **Process Engine** section.

Technical Stack – Short Format
